# **CS553 Cloud computing - Homework 4**

Name: Batkhishig Dulamsurankhor

CWID: A20543498

| Hardware information | 1 |
|----------------------|---|
| Test results         |   |
| CPU benchmark        |   |
| Graphs               | 3 |

## Hardware information

CPU: 32x Intel(R) Xeon(R) Silver 4108 CPU @ 1.80GHz

Memory: 64GB

• Disk: Micron\_5100\_MTFD 240GB

### Test results

I have written a **run.sh** script to automate the testing and saving the results to files. After running the benchmark and collecting them in the host machine, we can use **plot.py** script to plot graphs for each of the benchmarks (cpu, memory, disk and network) from the raw log files. The instruction to use these scripts is in the README.md file.

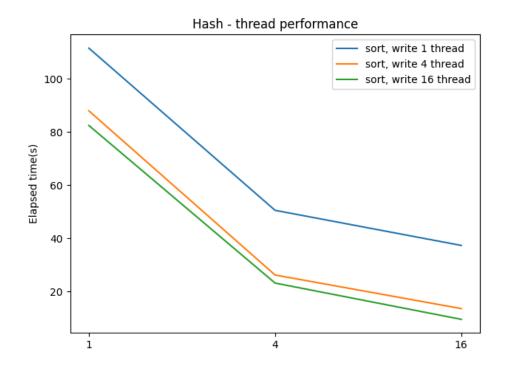

### CPU benchmark

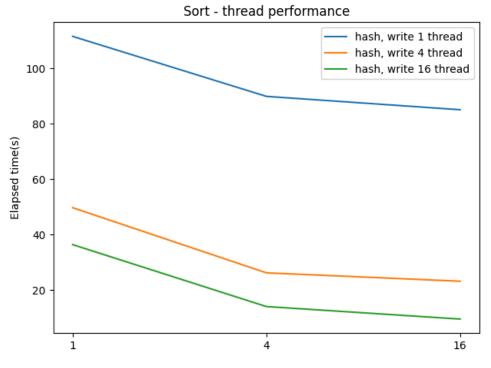

Following is the test result for 1GB small file for variable thread configurations for hashing, sorting and writing to a file. The performance gain is calculated by 100-elapsed\_time/(1,1,1 thread elapsed time)\*100. Relative performance to the test done with 1 thread for each stage of the test.

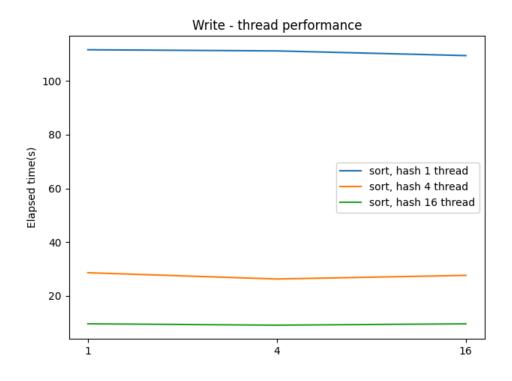

| Hash thread count | Sort thread count | Write thread count | Total elapsed time(s) | Performance boost |
|-------------------|-------------------|--------------------|-----------------------|-------------------|
| 1                 | 1                 | 1                  | 111.598420            | 0.00%             |
| 1                 | 1                 | 4                  | 111.177812            | 0.38%             |
| 1                 | 1                 | 16                 | 109.433756            | 1.94%             |
| 1                 | 4                 | 1                  | 89.949533             | 19.40%            |
| 1                 | 4                 | 4                  | 88.025533             | 21.12%            |

| 4                 | 16                | 4                  | 23.250475             | 79.17%            |
| 4                 | 16                | 16                 | 23.244591             | 79.17%            |
| 16                | 1                 | 1                  | 37.395826             | 66.49%            |
| 16                | 1                 | 4                  | 36.355394             | 67.42%            |
| 16                | 1                 | 16                 | 36.453942             | 67.33%            |
| 16                | 4                 | 1                  | 14.744985             | 86.79%            |
| 16                | 4                 | 4                  | 13.647057             | 87.77%            |
| 16                | 4                 | 16                 | 14.108865             | 87.36%            |
| 16                | 16                | 1                  | 9.606335              | 91.39%            |
| 16                | 16                | 4                  | 9.088045              | 91.86%            |
| 16                | 16                | 16                 | 9.597904              | 91.40%            |

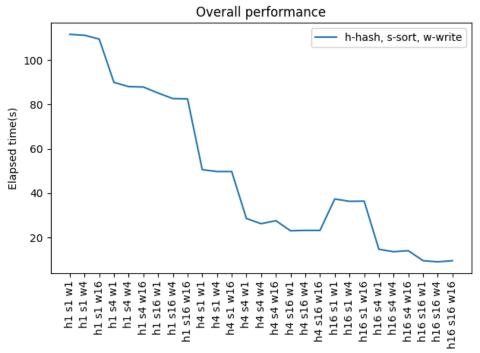

From the results, we can see that hash generation had the most benefit from multithreading, while writing to a file didn't have much gain. Writing with 16 threads had more overheads than performance gain in some cases.

## Graphs
